PALENT COOPERATION TREAT

From the INTERNATIONAL BUREAU

PCT

NOTIFICATION OF ELECTION

(PCT Rule 61.2)

To:

Assistant Commissioner for Patents United States Patent and Trademark Office Box PCT Washington, D.C.20231 ETATS-UNIS D'AMERIQUE

Date of mailing (day/month/year) 05 April 2000 (05.04.00)	in its capacity as elected Office
International application No. PCT/US99/16650	Applicant's or agent's file reference 8407
International filing date (day/month/year) 22 July 1999 (22.07.99)	Priority date (day/month/year) 24 July 1998 (24.07.98)
Applicant WIRES, Duane, L.	

	The designated Office is hereby notified of its election made: X in the demand filed with the International Preliminary Examining Authority on:
	27 January 2000 (27.01.00)
	in a notice effecting later election filed with the International Bureau on:
	· · · · · · · · · · · · · · · · · · ·
2.	The election X was
	was not
	made before the expiration of 19 months from the priority date or, where Rule 32 applies, within the time limit under Rule 32.2(b).

The International Bureau of WIPO 34, chemin des Colombettes 1211 Geneva 20, Switzerland **Authorized officer**

Jean-Marc Vivet

1.	statement			
	Novelty (N)	Claims	1-17, 19, 22, 24, 25	YES
	, ,	Claims	18. 20. 21. 23. 26, 27	NO
	Inventive Step (IS)	Claims	NONE	YES
		Claims	1-27	NO
	Industrial Applicability (IA)	Claims	1-27	YES
	• •	Claims	NONE	NO

2. citations and explanations (Rule 70.7)

- Claim 18 lacks novelty under PCT Article 33(2) as being anticipated by either of Orlosky or Buazza et al (col. 18. lines 6-13). Either applied reference discloses the instant UV transparent gasket with the instant upper and lower inner edges which removably secure front and back molds and define a cavity therebetween.

Claims 20, 21, 23, 26 and 27 lack novelty under PCT Article 33(2) as being anticipated by Blum. Blum (col. 14, line 20) discloses a coating material and method using a photochromic material in a base medium being applied to a lens substrate, the base medium being an acrylate or epoxy resin.

Claims 1-17 lack an inventive step under PCT Article 33(3) as being obvious over Buazza et al in view of Blum. Buazza et al discloses the basic claimed method, composition and apparatus lacking essentially a front mold with a UV-reflective surface and a photochromic material in the resin. Blum discloses the instant photochromic material in the resin (col. 4, line 20) and a mold with a UV-reflective surface (col. 10, lines 46-50). It would have been obvious to one of ordinary skill in the art to modify the process and apparatus of Buazza et al by using a mold with a UV-reflective surface as taught by Blum to increase the amount of UV light directed to the composition. Likewise, it would have been obvious to have included a photochromic material in the resin of Buazza et al as taught by Blum to make a light-responsive lens. The mixed photoinitiator is well known in the art and would have been an obvious material selection over the single initiator disclosed in Buazza et al to facilitate the curing.

Claims 19, 22, 24 and 25 lack an inventive step under PCT Article 33(3) as being obvious over Blum. Blum discloses the basic claimed nickel mold (col. 13, line 61) lacking essentially that the reflective surface is a hard carbon surface. One of ordinary skill in the art would have found a carbon coating as an obvious modification to the polishing described in the reference dependent on the degree of UV-(Continued on Supplemental Sheet.)

5 I CLAIM:

A method for making a plastic lens comprising
 providing a front mold having a reflective, nonultraviolet (UV) absorptive inner surface;

providing a back mold which is UV light transmissive; disposing the front mold and the back mold in a UV light transparent gasket, the gasket defining a lower inner edge for removably securing the front mold to the gasket, the gasket further defining an upper inner edge for holding the back mold in a spaced apart relationship to the lower inner edge, the space between the upper and lower inner edges defining a lens forming cavity when the front mold and the back mold are positioned in the gasket;

dispensing a predetermined quantity of a UV curable lens forming resin material in the lens forming cavity, the resin material comprising at least one a polymerizable material and at least one photoinitiator, which cure when exposed to UV light; and,

exposing the dispensed resin material in the lens forming cavity to a source of UV light for a predetermined length of time at a predetermined intensity to cure the resin material.

25 2. The method of claim 1, in which the UV light passes through a diffusion member before the UV light passes through and cures the lens forming resin material.

PCT/US99/16650

- 3. The method of claim 2, in which the resin material in the lens forming cavity is rotated about an axis extending perpendicular to the plane of the lens during the curing of the lens forming resin material.
- 5 4. The method of claim 1, in which the front mold comprises a nickel material coated with a hard carbon surface.
 - 5. The method of claim 1, in which the back mold comprises a transparent glass material.

10

30

- 6. The method of claim 1, in which the lens forming resin material is exposed to UV light for a period of two and a half minutes or less.
- 7. The method of claim 1, in which the gasket is removed, exposing the edge of the cured lens material and a force is applied at least a portion of an edge of the front and/or back molds to remove the lens from the front and back molds.
- 20 8. The method of claim 1, in which the photoinitiator comprises a mixture of bis (2,6-dimethoxybenzoyl)-2,4-,4-trimethylpentyl phosphine oxide and 2-hydroxy-2-methyl-1-phenyl-propan-1-one.
- 9. The method of claim 1, in which the resin material furthercomprises at least one photochromatic dye material.
 - 10. A polymerizable resin material comprising: i) a photoinitiator comprising a mixture of bis (2,6-dimethoxybenzoyl)-2,4-,4-trimethylpentyl phosphine oxide and 2-hydroxy-2-methyl-1-phenyl-propan-1-one, and ii) a polymer material which, when exposed to UV light for a period of two

10

20

and a half minutes or less, cures without need for the addition of heat to the polymerizable resin material.

- 11. The polymerizable resin material of claim 10, wherein thepolymer material comprises a monomer.
 - 12. A polymerizable resin material comprising i) at least one photoinitiator comprising a mixture of bis(2,6-dimethoxybenzoyl)-2,4-,4-trimethylpentyl phosphine oxide and 2-hydroxy-2-methyl-1-phenyl-propan-1-one, ii) at lest one polymer material which, when exposed to UV light for a period of two and a half minutes or less, cures without need for the addition of heat to the polymerizable resin material, and iii) at least one photochromatic dye.
- 15 13. An apparatus for making a plastic lens comprising a front mold having a reflective, non UV absorptive inner surface;

a back mold which is UV light transmissive;

a UV light transparent gasket, the gasket having a lower inner edge for securing the front mold to the gasket and an upper inner edge in a spaced apart relationship to the lower inner edge for holding the back mold in a spaced apart relationship to the front mold, the spaced apart front mold and the back mold defining a lens forming cavity;

a means for dispensing a predetermined quantity of a UV curable lens forming resin material in the cavity, the resin material comprising a mixture of a polymerizable material and a photoinitiator which mixture cures when exposed to UV light in less than about two and one half minutes; and,

a means for exposing the dispensed resin in the lens forming cavity to a source of UV light for a predetermined length of time at a predetermined intensity to cure the resin material.

- 5 14. The apparatus of claim 13, wherein the UV light passes through a diffusion member before the UV light passes through and cures the lens forming resin material.
- 15. The apparatus of claim 14, wherein a turn table rotates the resin material in the lens forming cavity about an axis extending perpendicular to the plane of the lens during the curing of the lens forming resin material.
- 16. The apparatus of claim 13, wherein which the front mold15 comprises a nickel material coated with a hard carbon surface.
 - 17. The apparatus of claim 13, wherein which the back mold comprises a transparent glass material.
- 18. A gasket for use in making a plastic lens comprising a UV light transparent gasket having a lower inner edge for securing a front mold to the gasket and an upper inner edge for holding a back mold in a spaced apart relationship to the lower inner edge, the upper and lower inner edges defining a lens forming cavity when the front mold and the back mold are removably secured in the gasket.
 - 19. A front mold for use in making a plastic lens, the front mold comprising a nickel material coated with a hard carbon surface.

- 20. A method for coating a substrate comprising coating the substrate with at least one photochromatic composition and curing the coated composition.
- 5 21. The method of claim 20, wherein the coated substrate is exposed to a source of UV light for a predetermined length of time at a predetermined intensity to cure the coating material.
- 22. The method of claim 20, in which the UV light passes 10 through a diffusion member before the UV light passes through and cures the coating material.
 - 23. The method of claim 20, in which the substrate comprises an optical lens.

15

- 24. The method of claim 20, in which the substrate comprises a frame for optical lenses.
